ROYAL COMMISSION OF INQUIRY INTO CERTAIN
DEATHS AT THE HOSPITAL FOR SICK CHILDREN
AND RELATED MATTERS

Hearing held on the 21st Floor,
180 Dundas Street West, Toronto,
Ontario, on Monday, the 25th day
of June, 1984.

THE HONOURABLE MR. JUSTICE S.G.M. GRANGE - Commissioner
THOMAS MILLAR - Administrator
MURRAY R. ELLIOT - Administrator

APPEARANCES:

P.S.A. LAMEK, Q.C.)	Commission Counsel
E. CRONK)	
L. CECCHETTO	Counsel for the Attorney- General and Solicitor General of Ontario (Crown Attorneys and Coroners' Office
I.J. ROLAND)	
M. THOMSON)	Counsel for The Hospital for Sick Children
R. BATTY)	
B. PERCIVAL, Q.C.	Counsel for The Metropolitan Toronto Police
K. CHOWN	Counsel for numerous Doctors at The Hospital for Sick Children
J. SOPINKA, Q.C.	Counsel for Susan Nelles - Nurse
D. BROWN	
G.R. STRATHY	Counsel for Phyllis Trayner - Nurse
P. RAE

APPEARANCES: (Continued)

3

F.H. SHANAHAN

Counsel for Mr. & Mrs. Dominic Lombardo (parents of deceased child Lombardo); and Heather Dawson (mother of deceased child Amber Dawson)

4

5

J. SHINEHOFT

Counsel for Lorie Pacsai and Kevin Grant (parents of deceased child Kevin Pacsai)

6

7

F. KITELY

Counsel for the Registered Nurses' Association of Ontario and 35 Registered Nurses at The Hospital for Sick Children

2

---On commencing at 10:00 a.m.

3

THE COMMISSIONER: Well now I guess I
should call Mr. Shanahan, first, but he is not here.

4

5

Mr. Shinehoft, are you next, or is
Mr. Tobias next?

6

7

Mr. Tobias is next but he is not
here so, Mr. Shinehoft.

8

9

10

11

12

13

MR. SHINEHOFT: Well, I have a comment
I would like to make in this regard, Mr. Commissioner.
I don't know whether it will have some disfavour with
you or not. It seems to me the order of presentation
of the argument is such that we are in a position as
parent's counsel where we have to reply to our own
argument.

14

15

THE COMMISSIONER: The great advantage
of that is you don't have any work to do.

16

17

MR. SHINEHOFT: That may be so.
I would like if possible --

18

19

20

21

22

23

24

25

THE COMMISSIONER: They are replying to
you and you can't then reply to their reply to you
that's all. However, I never follow the rules and
if you get desperate I will hear from you, but that
means of course - if at the end you find you are in
bad shape that somebody has said something - but
in the ordinary course what happens is, you know, it

1
2 depends on the kind of trial usually we hear from
3 the plaintiff's counsel, the defendant's counsel and
4 the plaintiff's counsel and then if you hear from
5 defendant's counsel this thing could go on forever.

6 MR. SHINEHOFT: Well, I am not
7 proposing that, Mr. Commissioner. What I am saying
8 is, and I know you will treat it with every application
9 individually, that it may be that either myself or
10 one of the parent's counsel may wish to make one or
11 two comments after all the submissions and reply is
12 in.

13 Thank you.

14 THE COMMISSIONER: All right. Thank
15 you. Mr. Labow?

16 Mr. Labow is not here.

17 Miss Kitley.

18 REPLY ARGUMENT BY MS. KITELY

19 MS. KITELY: Very briefly, sir, I
20 understand that Mr. Roland will be making submissions
21 to you by way of reply. I don't know exactly what
22 he is going to say but I can surmise some of the
23 logistics of his submission. Could I say, sir,
24 that probably I will agree with those that Mr.
25 Roland will be making with respect to the guidelines
that Mr. Scott proposed to you and allow myself 30

1
2 seconds when he is finished to agree or disagree
3 with the position he has taken. I say that, sir,
4 to avoid the necessity of my replying to you, I know
5 that Mr. Roland is going to do a brilliant job.

6 THE COMMISSIONER: One thing, we
7 will know if she stands up that your job wasn't that
8 great.

9 MR. SOPINKA: Does she know what
10 that is worth to a lawyer on national television.

11 THE COMMISSIONER: All right. Nobody
12 seems to be too pleased with the system but there
13 it is.

14 Mr. Young.

15 MR. YOUNG: Sir, we have no reply.

16 THE COMMISSIONER: Oh yes, I am
17 sorry.

18 MS. KITELY: Sir, I have two other
19 brief points to make. Much has been said to you in
20 the last couple of weeks about patterns, and the rest
21 of my submissions I am in agreement with Mr. Scott
22 that the pattern ought to be the end, not the means
23 to the end. Could I remind you, sir, of the position
24 taken in fact by Mr. Lamek. That was according to
25 my account, Commission Counsel has eliminated 10 from
the categories of suspicion or high level or low

1
2 level of suspicion. If we eliminate even those 10
3 and I of course go much further, if we eliminate those
4 10 then we are down to 26, the fewer the number the
5 less compelling the pattern itself.

6 Finally, sir, Mr. Tobias in his
7 comments referred to Dr. Bain in Dr. Bain's evidence
8 that he had never seen a patient die of a medication
9 error. I do not mean to repeat my submission except
10 to point out that the whole thrust of it was to explain
11 how it could happen on the one hand, Dr. Bain had
12 the last word on that; but secondly and perhaps
13 more importantly that an error could account for a
14 level of digoxin, if not death, then certainly account
15 for a level, and those are my submissions.

16 Thank you, sir.

17 THE COMMISSIONER: Yes. All right,
18 thank you.

19 Miss Cecchetto.

20 MS. CECCHETTO: We have no reply,
21 sir.

22 THE COMMISSIONER: Yes, Mr. Strathy,
23 you are next.

24 REPLY ARGUMENT BY MR. STRATHY

25 MR. STRATHY: Yes, Mr. Commissioner.
Just very briefly, I do not propose to reply to any

1
2 of the submissions concerning the technical
3 aspects of the case as it relates to digoxin,
4 pharmacology, cardiology and so forth. I don't
5 think you would thank me for repeating what I said
6 in my principle submissions.

7 I only say that one of the critical
8 issues in this whole area seems to be the importance
9 of significance one can attach to the exhumed and
10 fixed tissues. In my respectful submission there
11 are some counsel who have urged upon you that you
12 should attach a greater importance than is apparent
13 from the opinions of those who are knowledgeable in
14 that particular area. I refer to the submissions that
15 I made in chief.

16 I would like, however, to comment
17 briefly on what seems to be a major split in the
18 submissions of counsel as to how you ought to approach
19 your task, as to what exactly your responsibility is.

20 I think the split lines up with Mr.
21 Scott, myself and Miss Kitely on the one hand and
22 the remainder of our friends on the other hand, with
23 perhaps Mr. Lamek and Miss Cronk attempting to steer
24 some sort of middle road.

25 I have two submissions with respect
to, what in my respectful submission is your obligation

1
2 To some extent it reiterates what I said in my
3 submissions in chief.

4 The first point is this. That it
5 goes without saying that your report when it is
6 finally prepared must be internally consistent if
7 you will, and I say this with respect, it must make
8 sense on its face. The Court of Appeal has said
9 what you may not say in your report. In my submission
10 it would be inappropriate for you to come to
11 conclusions in your report which are not supported
12 on the evidence which you are able to lay out in your
13 report. If one picks up your report five or ten
14 years down the line one would hope that one could
15 read it and say, all right, I see the findings here
16 and I see the conclusions here, and based on the
17 findings that are set out I can see how the Commissioner
18 comes to his --

17 THE COMMISSIONER: What you are
18 saying is I should reach a conclusion that I wouldn't
19 reach logically because I can't report.

20 MR. STRATHY: No, where you are not
21 able to reach a conclusion as a result of things that
22 you are not able to report on you should follow the
23 course which I suggested, and that is simply set out
24 the evidence. That we should not have to look behind
25

1
2 what you say in your report and attempt to guess at
3 how you came to your conclusions. I say that because
4 it would be a very damaging thing, dangerous thing,
5 if the public, the media and perhaps the Attorney-
6 General was forced to speculate as to how you came
7 to your conclusions, because then they might speculate
8 that you came to your conclusions based on things
9 that in fact were not reasons in your mind.

10 So that there is, with respect, a
11 middle ground which you can take and that is where the
12 injunction of the Court of Appeal does not allow you
13 to state the facts upon which you rely, to simply set
14 out the evidence, in my submission, that is really
15 quite clearly set out in your mandate and in your
16 terms of reference.

17 THE COMMISSIONER: I would like to
18 follow this up a bit; set out the evidence, you mean
19 something like the Atlanta Report?

20 MR. STRATHY: I think the Atlanta
21 Report is clearly before the Attorney-General and it
22 is clearly before the public. What I am talking
23 about is the evidence as to how and by what means
24 the pharmacological, medical, toxicological evidence --

25 THE COMMISSIONER: I can certainly
set out that, that can certainly be a basis for reaching

1
2 whatever conclusion I do reach, there is no problem
3 about that. The problem is the pattern, can I set
4 forth the pattern in the report?

5 MR. STRATHY: I don't see, sir, any
6 reason why you need set out the pattern. The pattern
7 of the Atlanta Report evidence has been filed, the
8 Atlanta Report was delivered to the Attorney-General.

9 THE COMMISSIONER: It has been argued
10 before me the pattern, one of the things that I should
11 take into consideration and it seems to me I would
12 have to deal with that argument, I don't have to accept
13 it, but the pattern of the time of night, the presence
14 of one team on the scene at all times, that is the
15 pattern that is part of the circumstantial case that
16 is being made for death by digoxin toxicity.

17 Now do I set that out?

18 MR. STRATHY: I don't see that
19 you need set it out, sir.

20 THE COMMISSIONER: Just assuming that
21 I accept the argument, one of the things that caused
22 me to reach the conclusion of digoxin toxicity,
23 should I set it out in the report, if it is, if I
24 think it is?

25 MR. STRATHY: What I think you
might do is simply refer to the evidence with respect

1
2 to pattern without more. Simply say this is the
3 evidence, lay out the evidence, but not necessarily
4 are you obliged to say, because of this evidence I
5 conclude that the scale is tipped because I think
6 that contravenes --

7 THE COMMISSIONER: Supposing it is
8 a fact, then you say the reader does not know anything
9 about the problems we have had to face reading the
10 report, if I reach that conclusion, if you can only
11 understand I have reached that conclusion of setting
12 forth the facts that led me to the conclusion.

13 I just simply ask you, should I,
14 should I put those facts in.

15 MR. STRATHY: I think I have said
16 two things and perhaps I haven't said the second thing,
17 but I support what Mr. Scott said if pattern is all
18 you have to go on you --

19 THE COMMISSIONER: I should not
20 accept it.

21 MR. STRATHY: No.

22 THE COMMISSIONER: No, it is an
23 argument that has been put forward and I have to
24 deal with it, and at least I have to deal with it
25 in my mind. Whether I have to deal with it in the
report or not I don't know, but I have to reach the

MR. STRATHY: I think the answer then that I have to give you is that it is much more dangerous for you to come to a conclusion on which the evidence is not revealed, in your report, than it is for you to at least set out the evidence in some neutral way.

I hope you understand my submission, sir. It is this, that there is a danger of you coming to a conclusion on a particular child for which a reader looking at the evidence says: I don't understand how the Commissioner reached this conclusion.

THE COMMISSIONER: That is right; that is what Mr. Justice Krever calls an unintelligible report.

MR. STRATHY: I am not sure. I have said two things, the one is I do not think you should be looking at the pattern --

THE COMMISSIONER: I have to deal with the argument. Logically I have to deal with the argument that has been put. Does the pattern affect it at all?

MR. STRATHY: Presumably if you think it is an important piece of evidence you report on the piece of evidence which is what the Court of Appeal has said, you may report on that.

THE COMMISSIONER: What about the

24

25

argument? I report on the evidence. The evidence is in most instances, most of these children, one team was on duty at the time. I report that fact. Then what do I say? If I reach a conclusion that the children were poisoned do I say that that is the one of the reasons --

MR. STRATHY: That is what the Court of Appeal has said that you may not do.

THE COMMISSIONER: Then how does this report become intelligible?

MR. STRATHY: At least it sets out the evidence.

THE COMMISSIONER: I do not say whether I accept the evidence or not, is that it?

MR. STRATHY: I think that is a problem you are faced with in view of the Court of Appeal's injunction. I think the only thing that I offer to you is a way of dealing with that and that is not coming to a conclusion in a particular case. It is simply saying that in view of the evidence and in view of what I have been told by the Court of Appeal, I am not in a position with respect to these children to state a conclusion.

THE COMMISSIONER: That is not what they say. They say I am to analyse.

20
21
22
23
24
25

MR. STRATHY: They say you are to analyse and report on the evidence.

THE COMMISSIONER:

"The Commissioner is obliged to hear all of the evidence relating to the cause of death of the children and this would include evidence which tended to show that one or more of them died as a result ... he should analyse and report on all of the evidence with respect to the circumstances of each death and if he can, make recommendations with respect to that evidence "

There is the problem, they said I cannot - but this is an argument that has been put to me by several counsel that because of the presence of a pattern I can conclude that it was digoxin poisoning.

MR. STRATHY: We go back to what I said in my main submissions to you, sir, what the Court of Appeal said is that you are to analyse and report on all of the evidence, not to determine on the evidence but to report on the evidence. What I say to you is that if you confine yourself to reporting on the evidence and not determining then you fulfill the obligation imposed by your terms of reference

1
2 and you do not stray from what the Court of Appeal has
3 said that you must do.

4 THE COMMISSIONER: This reader of yours,
5 this fictitious reader, I must say, because I don't
6 know of anybody who is reading any back reports on
7 any subject, but assuming --

8 MR. STRATHY: Apparently, Miss Kitley
9 has, and government people.

10 THE COMMISSIONER: Maybe. Whoever it is
11 that reads this report in 1994 and says: how can he
12 possibly reach that conclusion, I suppose what he can
13 do is analyse and reach a conclusion whereas I cannot.
14 Is that the idea? The evidence is all there for him
15 and he says that the Commissioner clearly did not
16 act upon this, he reached the conclusion but he
17 should have reached it in a different way or should
18 have reached it the same way by a different route.

19 MR. STRATHY: I think what he can say
20 is the Commissioner, because of his terms of reference
21 and because of what the Court of Appeal has said to
22 him did not come to a determination or come to a
23 conclusion in this particular case. What the
24 Commissioner did, being faithful to his terms of
25 reference, was simply to report upon the evidence.
The Commissioner simply sets out the evidence. I

B-5

1
2 submitted to you, sir, in my submissions in chief that
3 there is a significance to the fact that your terms
4 of reference do not require you to determine how and
5 by what means. If you were sitting as a coroner with
6 a coroner's jury the jury would be obliged to determine
7 how and by what means.

8 THE COMMISSIONER: Yes.

9 MR. STRATHY: I think you have my
10 point on that.

11 My other point was with respect to
12 the burden. You made an observation when Mr. Tobias
13 was in the course of his submission to the effect
14 that because your report did not have an effect on
15 any person, in other words, since you are not censuring
16 any person or imposing a penalty upon any person or
17 affecting, because of the Court of Appeal, any person
18 directly or indirectly, that cases with respect to
19 burden did not have an application. At least that is
20 how I read your exchange with Mr. Tobias.

21 THE COMMISSIONER: I don't know if I
22 went quite that far. I think it would have some
23 effect on it.

24 MR. STRATHY: I would like to respond
25 to that. I think that if you are in effect saying
in any case that a child received an intentional

1
2 dose of digoxin, and let us leave aside numbers,
3 let us say any one case or any one child at the
4 Hospital for Sick Children, if you turn to the
5 parents of that child and the public, in my submission
6 the level of assurance you want to have, to use Mr.
7 Scott's expression, you want to have a full measure
8 of assurance.

9 THE COMMISSIONER: Surely it is a little
10 bit different if the person is not identified than if
11 the person is.

12 MR. STRATHY: With respect, I do not
13 think it is. I think the significance of saying to
14 a parent or to the public that a parent's child has
15 been murdered requires a very great measure of
16 assurance. It is the same if you say that to the
17 public generally, to say that the child at this
18 Hospital has been murdered in my submission calls
19 for a greater level of assurance than you would apply
20 in a civil case, for example, saying the light was
21 red or the light was green.

22 The significance of that finding, the
23 nature of the finding itself, calls for a greater
24 degree of certainty and a greater weight in the evidence.

25 Anticipating what Mr. Roland is going
to submit to you, sir, I have no further submissions.

THE COMMISSIONER: Mr. Sopinka.

REPLY ARGUMENT BY MR. SOPINKA:

MR. SOPINKA: If you do not mind, sir, I will use the lectern. It allows me to see you at a different perspective. I am a little intimidated being so close.

THE COMMISSIONER: That is one of your arguments that will under no circumstances be accepted.

MR. SOPINKA: First of all I think I should clear up our position with respect to the argument as to whether or not it was murder or not murder. Mr. Strathy implied, I gather, that we are in the murder camp. I made it very clear during my argument that we are taking no position. There are arguments both ways. What I dealt with was the worst case. Assuming it was murder and assuming that the eight children that Mr. Lamak felt were murdered then I submitted that Miss Nelles was not part of the pattern.

I wish to respond to a statement that was made by Mr. Percival at page 1507 of the transcript. He was referring to Mr. Lamak's four propositions as to why the deaths had ceased and he said that it was interesting to note that Mr. Lamak did not note a fifth possibility, a proposition that Miss Nelles was

working in conjunction with another individual.

There was obviously a very good reason for Mr. Lamek not referring to that because he was careful to base his submissions on circumstances where there was some evidence and this had not been pursued by any counsel. There was absolutely no evidence with respect to it. I submit that on ethical grounds as well as a rule of fairness and a rule of evidence, grounded on unfairness that was an improper statement.

THE COMMISSIONER: Certainly I think as I indicated to Mr. Brown, if there is to be evidence offered --

THE COMMISSIONER: I should follow Miss Kitley's example and get out a certain book to present to you but if evidence is to be presented it must be - it is our discovery rule, but it must be put to the witness for -for concrete evidence it must be, but surely the inferences drawn on the evidence that is there is partly legitimate to put an inference to the Court and the Court can either accept it or not accept it.

What I said to Mr. Percival - my resolution on that problem - is that I couldn't put it in the report anyway.

MR. SOPINKA: Well --

THE COMMISSIONER: Or make any suggestions as to Susan Nelles or anyone.

MR. SOPINKA: I submit that it was unethical for him to make that statement and I am going to cite authority.

THE COMMISSIONER: All right.

MR. SOPINKA: And I submit that he should not have said it in argument in view of the fact that there was no evidence, but more importantly that it had never been put to Miss Nelles and there is a very well known rule that has been adopted by

1
2 the Supreme Court of Canada that you shouldn't even
3 argue about a matter imputing bad character or
4 attacking the credibility of a witness unless you
5 had the courage to put that evidence frontly to the
6 witness when the witness was in the witness box.

7 There was certainly no evidence of
8 any conspiracy by Susan Nelles led before this
9 Commission that it implicated her.

10 The farthest that you could take it
11 was that there was a theory that Mr. Percival put, once
12 or twice, that maybe there was another nurse acting
13 as a lookout but there was absolutely nothing to
14 support that. It was just made out of old cloth.
15 And certainly any suggestions that he made didn't
16 involve Miss Nelles. So, as far as any theory
17 implicating Miss Nelles as a lookout or anything
18 else, there is absolutely nothing in the evidence
19 to suggest it.

20 His Honour, Judge Vanek, was careful
21 to point this out at the Preliminary Hearing. In
22 his Reasons at Page 37 - and, of course, you are
23 entitled under the Order-in-Council to have regard
24 for what Mr. Vanek said.

25 He said:

"There is no suggestion in the

25

"evidence of any conspiracy to
commit these offences and it is
entirely unlikely that two or more
people acting independently would
go about the Hospital killing babies
by digitalis poisoning."

In other words, he said there is no
evidence of conspiracy and it is unlikely that two
people would be doing it independently.

So that there, where the Crown and
the Police had every opportunity to lead evidence have
led no such evidence and in my submission they have
led no such evidence here.

Now, the rules of professional
conduct provide in Ruling 8:

"A lawyer must not knowingly assert
that for which there is no reasonable
basis in the evidence."

Mr. Lamek, in his argument, was very
careful to point out that when he was making - or
pointing out the four possibilities - and one of them
was that when Susan Nelles was arrested they had
arrested the culprit. He said:

"Let me stress, there is absolutely
no evidence for any of the first three

1
2 "of these."

3 Now, if all Mr. Percival was doing
4 was adding a fourth possible theory, he should have
5 pointed out that there was absolutely no evidence to
6 support it but he was just making it out of old cloth.

7 That ruling is no idle provision.
8 A very famous barrister in this jurisdiction was
9 charged by the Law Society when he made imputations
10 in a fatal accidents case certain persons were
11 implicated in the death of the victim and it turned
12 out that there was no evidence with respect to
13 that.

14 Now, the second basis on which
15 I submit, with respect, that the statement was
16 improper was that Miss Nelles testified fully about
17 the care of the children and denied any complicity,
18 conspiratorial or otherwise in the deaths.

19 There was never any suggestion from
20 Mr. Percival that she was involved in a conspiracy
21 and she left the witness box without that imputation
22 ever having been put to her.

23 I submit that fairness requires
24 that a counsel who intends to make allegations
25 against the credibility or character of a witness
must confront the witness while the witness is in

1
2 the witness box, to give the witness an opportunity
3 to explain. In other words, in combat and in
4 litigation, sneak attacks are frowned on.

5 Now, I want to refer you to the law
6 with respect - and I am sure it is familiar to you -
7 but it bears repeating in this case because it is
8 clear that it is not just if, ^{as} is a matter of
9 argument, that should not even be argued. If you did
10 not comply with that rule it shouldn't be argued to
the jury or to the judge.

11 Now, I appreciate that you are not
12 bound by the rules of evidence but I think you have
13 exhibited the rules of fairness to apply.

14 In the famous case of Browne v.
15 Dunn, which is reported in 1894, 6th Law Reports,
67, Lord Herschel said this:

16 "Now, My Lord^s I cannot help saying
17 that it seems to me to be absolutely
18 essential to the proper conduct of
19 a cause where it is intended to suggest
20 that a witness is not speaking the
21 truth on a particular point to direct
22 his attention to the fact by some
23 questions put in cross-examination
24 showing that that imputation is intended
25

1
2 "to be made, and not to take his
3 evidence and pass it by as a matter
4 altogether unchallenged, and then when
5 it is impossible for him to explain,
6 as, perhaps, he might have been able
7 to do if such questions had been put
8 to him, the circumstances which it is
9 suggested indicates that the story
10 that he tells ought not to be believed
11 to argue that he is a witness un-
12 worthy of credit.

13 My Lords I have always understood
14 that if you intend to impeach a
15 witness you are bound, while he is in
16 the box, to give him an opportunity
17 to make any explanation which is open
18 to him. As it seems to me that it
19 is not only a rule a professional
20 practice in the conduct of the a
21 case but it is essential to fair
22 play and fair dealings with witnesses.
23 To my mind...."

24 And this is Lord Halsbury:

25 "To my mind nothing would be more
absolutely unjust than not to

1 "cross-examine witnesses upon evidence
2 which they have given so as to give
3 them notice and to give them an
4 opportunity of explanation, and an
5 opportunity very often to defend their
6 own character. And not having given
7 them such an opportunity, to ask the
8 jury afterwards to disbelieve what
9 they have said, although not one
10 question has been directed either
11 to their credit or
12 to the accuracy of the facts that they
13 have deposed to."

14 THE COMMISSIONER: Well, I am not
15 defending Mr. Percival. One of the reasons I am not
16 defending him is that it is totally irrelevant to me
17 because it is something that I cannot report on.
18 But, surely Miss Nelles made it perfectly clear in
19 her evidence that, first of all, she did not kill
20 any of the children, and secondly, she was not
21 engaged in any sort of conspiracy with anyone else.

22 It certainly never entered my head
23 that she was leaving any opening that way. There is
24 no question that that was her position and so she was
25 not led astray in any way by the failure to ask that
question.

MR. SOPINKA: No, but there might have been -

1 I mean, the suggestion that she might of been
2 conspiring, there may have been a great deal of evidence
3 that she might of given to refute that or relationships
4 that might negative that there could ever be such an
5 agreement and so forth.

6
7
8 That was never put. And I think that is the reason
9 for the rule and I think that it is particularly
10 important in this kind of a case.

11 And I asked Mr. Percival, does he
12 have any idea in these circumstances, when Miss Nelles
13 went through a long preliminary hearing and then the
14 Court said there is no evidence and she is trying to
15 rebuild her life. For this kind of statement to be
16 repeated on the front page of the Globe and Mail,
17 headlines in the media, does he appreciate what that
18 does to someone like Miss Nelles?

19 I am sure if he did he wouldn't make
20 irresponsible statements of that kind. Furthermore,
21 I submit, with respect, that if all people acting for
22 the police, given the past history of this thing, he
23 should be the last person to be making statements
24 about her unless it is based on evidence. Because
25 that is the accusation about the first part - the
preliminary hearing - and that is going to be the

1 subject of Phase II.

2 Now, that is all I have to say about
3 that matter.

4 On a smaller scale, Mr. Young
5 submitted that someone had attempted to kill Janice
6 Estrella on January the 7th - that was the long night
7 shift of January 6th - and that that should be taken
8 into account as part of the pattern.

8

9

10

16

17

18

19

20

21

22

23

24

25

DM/ko

1
2 I just want to point out that if that was part of the
3 pattern, Miss Nelles was not part of it because Baby
4 Estrella suffered an arrest on January 7th at 7:00 a.m.
5 and the sample was taken at 8:20 a.m. on January 7th
6 and it disclosed a digoxin concentration of 9.4 nano-
grams per millilitre.

7 Susan Nelles worked the long day shift
8 on January 6th, therefore she finished work at 7:00
9 or 7:30 p.m., she did not work the long night shift of
10 January 6th and she did not work the long night shift
11 on January 7th and did not return to the hospital until
12 the long day shift on January 10th.

13 Thank you, Mr. Commissioner.

14 THE COMMISSIONER: Thank you,
15 Mr. Sopinka. Ms. Chown.

16 REPLY ARGUMENT BY MS. CHOWN:

17 Thank you, Mr. Commissioner. I have
18 three brief points to address, two arising out of
19 submissions made to you by Mr. Labow and one arising
out of the submissions made by Mr. Percival.

20 The first is with respect to Mr. Labow's
21 submissions found at Volume 158, page 1753. In that
22 volume Mr. Labow was making reference to the fact that
23 the cardiologists met prior to their giving evidence and
24 reviewed all the charts. It is his inference, as I draw
25

1
2 from that, at the bottom of page 1753 and going over
3 to the top of 1754, that this should in your evaluation
4 of the evidence lessen the weight to be given to it.

5 My response to that is this. You are
6 aware that a number of the doctors were called to
7 testify before you, and specifically Dr. Rowe was asked
8 to review each and every of the 36 patients. You are
9 aware that he did not have personal care and management
10 of many of those and certainly one purpose of the
11 review was to assist him and to enable him to come
12 before the Commission.

13 Secondly, it was a review for the
14 doctors themselves as they have stated, to see whether
15 the facts were correct. Whether they in their own
16 individual reviews at the time of the child's death
17 had failed to pick up something of significance. That
18 was how Dr. Fowler put it at Volume 34, page 6638. You
19 have heard in extensive evidence through Dr. Rowe, and
20 that was tendered by Mr. Ortved, that indeed this kind
21 of meeting is nothing unusual, it is in fact how the
22 doctors within the normal hospital routine review the
23 deaths and they do so not to get a party line
24 necessarily, a consensus, to put the care and the
25 management of the child before their colleagues and
to ask for their assistance in their perception of the

case. So you may contribute what weight you will --

THE COMMISSIONER: Certainly I don't think there was any suggestion by Mr. Labow or anybody else that there was anything improper in what they did, that was really what they should have done, but the result of it is you get all of them sitting together discussing it and inevitably they reached a sort of collective conclusion which is hard to back away from.

MS. CHOWN: I appreciate that.

THE COMMISSIONER: That is all he was saying. He certainly didn't suggest anything improper. In fact, I would think it a little improper if they hadn't done that, but that is what happened.

MS. CHOWN: My submission is simply that when you are assigning weight to their evidence there are many factors you can put into the equation and how much weight you give to it, I don't think the fact that they met to review these cases prior to Dr. Rowe giving testimony is something that should take away significantly from the weight of the doctors who were called and gave evidence on their particular patients with which they were involved.

THE COMMISSIONER: All right.

MS. CHOWN: Secondly, at the same volume Mr. Labow, at page 1734 was referred to the case

1
2 of Real Gosselin and made some comments to the effect
3 that he found it quite surprising about Dr. Freedom's,
4 as he put it, change of evidence, and he referred to
5 that as total change of evidence after his letter that
6 appeared in the chart from the referring physician.
7 We have heard excessive evidence on that point and I
8 would simply say I find it inappropriate of Mr. Labow
9 to characterize that evidence of Dr. Freedom at the
10 Commission is quite surprising. Dr. Freedom's evidence
11 in this regard, found at Volume 29, page 5385 and
12 following, in his direct examination by Miss Cronk was,
13 to be quite open and say, yes, I wrote this letter,
14 perhaps inappropriately, relying on what my resident
15 had told me. My own review of the chart showed that
16 the resident's perception was incorrect. And it is my
17 view that after he read the chart and the physical
18 findings therein that the child was not responding to
19 prostaglandin, he says that at page 5390, Volume 29,
20 it was very clear there was no good response to
21 prostaglandin and that the child remained in persistent
22 heart failure.

23 Also Dr. Freedom's evidence that he
24 brought this change of view concerning the Gosselin
25 child to the attention of the police during the
investigation. It was not in effect a change that came

1
2 very late prior to his giving testimony here. I think
3 he has been clear and forthright as to way that change
4 took place and I think you should have regard for his
5 evidence as given before you, of his being more fully
6 informed, if I can put it that way, of his review of
7 the clinical status of the child.

8 My third point is in response to the
9 submission made by Mr. Percival at Volume 157, page
10 1516. On that page Mr. Percival is referring to
11 Dr. Freedom's comments that someone was murdering the
12 babies. He calls Dr. Freedom pathetic, and goes on to
13 respond to the suggestion from Mr. Strathy that the
14 police officer swayed the doctor's view. It is really
15 his comment at the bottom of page 1516 I wish to
16 address my comments to and that sentence is:

17 "Clearly I think that his evidence
18 that those physicians were already
19 thinking that way ..."

20 that way being murder:

21 "... long before the police came into
22 the hospital."

23 It is rather a minor point,
24 Mr. Commissioner, but I really wish to confirm that
25 when the physicians involved in this matter first
began to think murder was not in any sense to be

described is long before the police came into the hospital. It was really only in mid-March of 1981 after the death of Kevin Pacsai that the doctors for the first time considered digoxin as having a role in the death of the child. As you are aware from the evidence given by Dr. Fowler who was instructed to conduct an investigation, he did so and that report which has been entered as Exhibit 110 was completed on March 20th, 1981, that is the Friday, that weekend, and circulated on that day. As we are aware from Exhibit 110, Dr. Fowler's review was undertaken not with any premise of foul play but looking to see whether innocent explanation, such as an error in the prescribed dosage and the calculation of the dosage drawn up, whether the medicine or the manufacturing could be an explanation. As you are aware, none of those lines of enquiry followed by Dr. Fowler produced an explanation and on receiving his report on Friday, March 20th, Dr. Rowe has testified that at that time he had to confront the possibility of intentional overdose. His evidence in that regard is Volume 17, page 2972 and following. So we are at Friday when at least the possibility of intentional overdose is being considered.

Dr. Freedom did indeed make the comment

1
2 that it was his view someone was murdering babies, and
3 his evidence in that regard is found at Volume 30,
4 page 5672 and following. There was a change from his
5 timing in that comment, from his evidence at the
6 preliminary inquiry, when he thought that comment was
7 made perhaps mid-afternoon Saturday, March 21st. His
8 evidence here after he became more aware of the
9 chronology was that in fact he made that comment some
10 time late Saturday night of March 21st after learning
11 of the levels in Allana Miller.

12 So simply by way of clarification I
13 would point out that it really was not until Friday,
14 March 20th at the earliest that the possibility
15 entered the physicians' heads; Dr. Freedom's comment
16 was made late Saturday night, and as we are all aware
17 events quickly overtook the matter at that point and
18 the police were there shortly after.

19 Thank you. Those are my submissions
20 in my reply.

21 THE COMMISSIONER: Thank you.
22 Mr. Roland.

23 REPLY ARGUMENT BY MR. ROLAND:

24 Sir, I would like to deal first with
25 the submissions made in a general sense by Ms. Kitley
and Mr. Strathy concerning medication errors. As we

1
2 know, I think it is abundantly clear from the evidence
3 that you have heard over the last year, medication
4 errors are a fact of life in every hospital. It is
5 fair to say that medication errors are often recognized
6 but many of them are not identified. The reason, the
7 major reason that a medication error is not identified
8 is that the person making the error does not recognize
9 that the error has been made and nothing noticeable
10 occurs as a result of the error. Most errors, as we
11 know from the evidence that has been put before you,
12 are minor in nature and of little or no real conse-
13 quence.

13 The errors that were detected on Wards
14 4A and 4B during the nine month period have been brought
15 to your attention in the evidence, and contrary to what
16 Mr. Strathy may have been suggesting all of the errors
17 that were detected by the hospital during that nine
18 month period have been put in evidence before you.
19 Since then we know there has been introduced on Wards
20 4A and 4B --

21 THE COMMISSIONER: You say that -
22 yes, Mr. Strathy.

23 MR. STRATHY: All that I was suggesting
24 was that Exhibit, I think it is 336 whatever it was
25 the list of the errors during the so-called epidemic

1
2 period was deficient in that it did not refer to some
3 two or three other errors that we knew had taken place
4 during that period. I wasn't suggesting the hospital
5 had in any way failed to disclose, or that the evidence
6 had failed to disclose the detected errors during that
7 period.

8 MR. ROLAND: Then we are agreed,
9 Mr. Strathy and I are agreed that all the errors
10 detected have been put before you.

11 THE COMMISSIONER: Perhaps not all
12 in one exhibit.

13 MR. ROLAND: No, that is right, but
14 the evidence discloses they have all been put before
15 you.

16 THE COMMISSIONER: Yes.

17 MR. ROLAND: In fact the other three
18 errors were before you before that exhibit. In any
19 event, the introduction of the unit dose system has
20 occurred since the nine month period, and although it
21 cannot, as we know from the evidence that we have seen
22 in the literature, entirely eliminate medication errors,
23 it has and will continue to substantially reduce the
24 number of such occurrences and it is the best medi-
25 cation system available for a hospital of the size of
the Hospital for Sick Children.

1
2 The medication history and the cause of
3 each of the 36 babies you are concerned with have been
4 thoroughly examined in this process and all of the
5 professional witnesses who have come before this
6 Inquiry have been satisfied that the prescribed
7 medication was entirely appropriate in the circumstances
8 of each individual infant.

9 The medication history of those babies
10 about which we have significant toxicological infor-
11 mation has been closely examined into for the
12 possibility of medication errors. We have not heard
13 anything to suggest that medication error was actually
14 involved in the deaths of any of those babies of which
15 we have significant toxicological information. There
16 has been much speculation but not a single fact that
17 would not permit a conclusion of drug error as the
18 cause of death of any of the 36 babies.

19 So that drug error as a theory is one
20 which is entirely speculative. It is possible and
21 remains possible because drug errors do occur, but it
22 is not something that can be asserted on the facts,
23 the particular facts that are before you concerning
24 the course of medication of the babies about which we
25 have toxicological information.

It is interesting to note that with

1
2 respect to at least some of those babies, and in
3 particular Lombardo, Pacsai, Miller, Hines and Cook
4 there was before you in evidence a fairly clear
5 recollection of the events immediately preceding the
6 deaths of those babies of the detailed events that
7 occurred in that time frame. Those are infants of
8 which there is significant toxicological information
9 concerning digoxin. So that although great time was
10 spent exploring the possibility of medication error
11 and the possibility I suppose is always alive, there
12 are not any facts before you that bear out the
possibility.

13 Second, sir, I would like to turn to
14 Ms. Kitley's recommendations which were part of her
15 written submission and begin at page 42 of her written
16 submission.
17

24

25

You will recall in that submission Miss Kitley recommends that you propose certain changes in procedure and practices and propose that an investigation take place about the introduction of certain systems of charting and otherwise, things like medication. It is a great list of recommendations. Let me say this about all of those recommendations, that you should not make any of them. We ask you not to make any of them for the following reasons: one, the recommendations concern matters were examined into in very large part by the Dubin Committee and reported on by that Committee.

Secondly, they were matters that were not examined into by this Commission and if you were inclined to make such recommendations as proposed by Miss Kitley you would be acting almost entirely on your own uninformed suspicions that such a recommendation might be useful.

THE COMMISSIONER: I think maybe I have enough problems.

MR. ROLAND: I think you do. These matters have not been examined in evidence by this Commission.

The third reason is because they have not been examined into, sir, you have no sense of

1
2 the implications or ramifications of such recommendations
3 on the operations of the Hospital. To make such
4 recommendations may adversely affect other Hospital
5 procedures. Such recommendations may be expensive
6 and hence require money devoted to them that might
7 otherwise be directed to other programs, projects
8 or needs. You, sir, would in an uninformed way be
9 setting priorities with no idea of the competing
10 considerations.

11 The fourth reason is where there may
12 be some little evidence that touches on the recommend-
13 ations that evidence deals with events that occurred
14 in 1980 and 1981. Since that time the Hospital has
15 re-examined many of its procedures and policies. It
16 has received and implemented many of the recommendations
17 set out in the Dubin Report and it has improved and
18 updated its own practices as a result of all of these
19 events so that to a great extent the recommendations
20 themselves are out of date.

21 Finally, sir, and much more technical
22 in a sense, some of the recommendations are beyond
23 your mandate because they ask you to recommend things
24 that go beyond Wards 4A and 4B. For instance with
25 respect to the administration of medication, Recommendation No. 1 under that heading asked that you recommend

E-3

1
2 that a unit dose system be implemented for all areas
3 of the Hospital. You have had no evidence whatsoever
4 to know whether that is appropriate for all areas of
5 the Hospital or not and the reason you have not is the
6 area that are beyond 4A and 4B are not part of your
7 mandate.

8 So I say, sir, in conclusion with
9 respect to those recommendations, if you examine them,
10 in light of the reasons I have given you for not
11 making them, you will find that each of them falls
12 prey to one or other of the criticisms I have advanced
13 for even considering recommendations.

14 Let me turn to Mr. Hunt's categorization
15 of the deaths and his comments about how you deal with
16 the deaths. He suggests that you should express your
17 suspicions or, to use Mr. Lamek's words, your nagging
18 suspicions about the possibility of digoxin playing
19 a role in the deaths of some of the infants. He says
20 you should do that because your suspicions are of
21 greater value as suspicions than other persons. I
22 agree that your suspicions may be of greater value in
23 the sense that they may include both your personal
24 interpretation of highly complex and scientific matters
25 and they may synthesize or sum up the suspicions of
others. But if your interpretation of the evidence

23

24

25

concerning any single infant does not bring you more than to a nagging suspicion all you would be saying is that you have an nagging doubt without proof or based on little useful evidence that an infant died of other than natural causes. So that such a nagging suspicion at its highest would then only slightly detract from what should be the principle conclusion

with respect to that infant, that is that the infant died naturally of its anatomical or medical condition. Because in a doubtful case like that, there will be in most of the cases abundant evidence or substantial amount of evidence to arrive at the conclusion that the child died of natural causes.

THE COMMISSIONER: There is evidence for all of these children that they died of natural causes.

MR. ROLAND: That is right, and what concerns me, sir, is that you give expression to your feelings of nagging suspicions or nagging doubts or somewhat doubtful because we have been through this exercise for a year now of examining into these matters and it seems to me unsatisfactory to leave them in the air as insubstantially expressed as that. This kind of expression is, with great respect, sir, more the vocabulary of a commentator or a spectator or a

25

journalist. It is not the primary vocabulary of an adjudicator who is appointed to decide the cause of death as best he is able to on the evidence before him.

THE COMMISSIONER Does it really matter whether I say that some of these children I don't know.

Does that make any real difference if I say that I don't know or if I say there is some suspicion that a child died of digoxin overdose. Does that matter one way or the other. If I examine and I cannot say that a child died a natural death, does it really matter how I word it.

MR. ROLAND: If you say after examining all of the evidence that you cannot know one way or the other but there are suspicions, you may also add that you suspect that the child died of natural causes as you may say that I suspect the child died of unnatural causes. If you really cannot know, if the balance is clearly even, then you have no choice but to say so; but in most cases there won't be.

Having made the decision, to then add nagging suspicion or doubt or very little or unsubstantial evidence when the evidence is more substantial going the other way, I say it is not something you are mandated to do.

1
2 After all, when you think back, when
3 this inquiry was first called, we had the conclusion
4 from Judge Vanek that Justin Cook was murdered. We
5 had that conclusion. Mr. Hunt's client had, most of
6 us did not, but Mr. Hunt's client had the C.D.C.
7 Report before this inquiry was called and that provided
8 the statistical information concerning access to the
9 infants that died on the ward by certain hospital
10 personnel. Surely then Mr. Hunt's client, the
11 Attorney General, appointed you to inquire into each
12 of the deaths, to choose between, where you could,
13 natural causes on the one hand and unnatural causes
14 on the other, not to leave the matter suspended in
15 the air by suspicions or nagging suspicions, if you
16 could choose.

17 Now, with respect to how you come to
18 the exercise, we have had argument I gather, which
19 I missed all, from Mr. Scott, Mr. Lamek and Mr. Hunt
20 about how you come to the exercise. Really it is a
21 question of theology.

22 THE COMMISSIONER: That is a proposition
23 I have not received yet.

24 MR. ROLAND: What Mr. Hunt is saying on
25 the one hand is that you take Justin Cook's as an
incident of murder, a case of murder and

E-7

1

2

3

4

you then look at the period, the nine month period
and you presume that they were all murders unless
proof is shown otherwise.

5

6

7

8

9

10

11

Mr. Scott is saying, on the other hand,
that you presume they all died of natural causes
unless there is proof in each individual case that
they did not die of natural causes, that is, that they
were murdered. That really then is the question of
theology, which end of the debate you start. Is the
character of man intrinsically good or it the
character of man intrinsically bad.

12

13

14

15

16

17

18

THE COMMISSIONER: Perhaps if you start
from scratch, what they are suggesting is having
established that there is in man some defect that you
establish by reason of Cook, you then become suspicious,
whereas you would not have been suspicious before. Isn't
that possible? Isn't that what normal people do.
They would say, one child has been murdered, and let
us look carefully at the other children.

19

20

21

22

23

24

25

MR. ROLAND: Yes, and you look carefully
at each one of the children to see, but you don't
I submit, because Cook was murdered, you do not simply
presume that each one of those children was murdered.
What the pattern does, is identifies for you, and this
is the reason that it causes you so much trouble, it

1
2 identifies not the murderer, it identifies the
3 culprit or the possible culprit, but not the murders
4 themselves. You have to look at each individual
5 case and the facts of each individual case to determine
6 whether or not there is sufficient evidence in each
7 of those individual cases to determine if murder
8 occurred. Having determined that, the C.D.C. Report
9 or the pattern may assist you in identifying who did it.
10 The problem that it has caused you and the
11 dilemma we have been in for several months now, the
12 Court of Appeal has told you you cannot do that, but
13 that is the real purpose of the pattern and its
14 proper use, not to decide that this case or that case
15 by itself was murder when there was no evidence other
16 than the pattern.

17 Thank you, sir. Those are my submissions.

18 THE COMMISSIONER: All right. Miss
19 Kitley.

20 REPLY ARGUMENT BY MS. KITLEY:

21 MS. KITLEY: Thank you for the thirty
22 seconds, sir. Having introduced Mr. Roland's submissions as
23 brilliant, I cannot agree with his first and second
24 points. I agree to a certain extent with his submission
25 with regard to Mr. Hunt, and I will say no more.

THE COMMISSIONER: Thank you.

REPLY ARGUMENT BY MR. YOUNG:

MR. YOUNG: Mr. Commissioner, I wonder if I might have the opportunity of a very, very briefly reply.

It was argued this morning by Mr. Sopinka that it was improper and unethical for Mr. Percival to submit that Susan Nelles may have been involved in a conspiracy. He said that this proposition was not supported by the evidence and went on to say that in fact that particular question, her involvement in a conspiracy, was not put to the witness. As was pointed out in his very next breath, that very question was put to the witness by her own counsel and she did deny any involvement in the deaths of these children.

Sir, whether Susan Nelles or someone else took the lives of these children is not a fact that I expected nor, sir, do I imagine that you expected them to freely admit, when they took the witness stand. The very fact that one denies an allegation or a question put to them does not mean that it is not open to counsel to make inferences based upon the denial. That, sir, is what we did.

I would remind you, sir, that there is some evidence from Meredith Frise and Liz Radojewski

1
2 that tends to indicate that two individuals may well
3 have been involved in murdering these children. Then,
4 based upon all of those facts, we made the allegation
5 that we did, I quite boldly state right now, sir,
6 that there is absolutely nothing unethical about
7 that.

8 Thank you, sir.

9 THE COMMISSIONER: Thank you. Mr.
10 Brown.

11 REPLY ARUMENT BY MR. BROWN:

12 MR. BROWN: I address myself, if I
13 might, sir, with your leave simply to the evidence of
14 Liz Radojewski and Meredith Frise. Having said that,
15 I cannot put my hands on the evidence.

THE COMMISSIONER: Well, can you refer me to them? But I think I know -- is it Miss Frise who said --

MR. BROWN: Miss Frise said that she mentioned that to the police either just prior to the end of the preliminary inquiry or shortly after the discharge.

Miss Frise also said significantly that she had absolutely no basis whatsoever for her opinion and that is clearly on the record, sir.

And then in respect of Mrs. Radojewski I believe at the bottom fifth portion of one page of this voluminous transcript - the lookout theory was put to her as perhaps accounting for the reason people could not detect a deliberate overdose of digoxin. She agreed with it. It was a hypothetical without reference to any particular person.

Beyond that, sir, I have no submissions.

THE COMMISSIONER: Yes. All right.
Thank you.

Do you want to take a break now?

MR. LAMEK: Yes. Could we take a break now, Mr. Commissioner, and I will be through by lunch.

THE COMMISSIONER: We will be through

1
2 by lunch, you say?

3 MR. LAMEK: Yes.

4 THE COMMISSIONER: And Miss Cronk,
5 are you going to --

6 MS. CRONK: I am not, sir.

7 THE COMMISSIONER: Well then, all
8 right. I think we will take our 20 minutes now.

9 MR. LAMEK: Thank you, sir.

10 --- Short recess

11 --- On resuming

12 THE COMMISSIONER: Well now, I am
13 going to make these announcements. The audience has
14 disappeared entirely, but I've been unable to move the
15 hard hearts of either Mr. Lamek or Miss Cronk to start
16 earlier in Phase II. So, it means the week of the 9th
17 of July we will start and in light of what problems
18 Mr. Hunt has, and Miss Cecchetto, and everyone seems
19 to be agreeable, we go five days that week from the
20 9th of July and we will not sit the following week,
21 nor the following two weeks. There will be three weeks
22 off. We will start on Tuesday after holidays which,
23 I think, is Tuesday, the 7th, - 7th of August, and we
24 will sit three days. We still have lost a day but we
25 may be able to rise above that and we may have to make
up that day that we have lost.

1
2 We will start on the 7th of August and
3 go on until the matter is disposed of, which I am not
4 making any predictions. I have done that in the past.

5 All right. Mr. Lamek?

6 MR. LAMEK: Thank you, sir.

7 REPLY ARGUMENT BY MR. LAMEK:

8 I have given a promise we will be
9 through by lunch.

10 Someone referred this morning, sir, to
11 dealing frontly with submissions that have been made.
12 I suppose that is how I propose to reply to a couple of
13 rather basic propositions put to you by my learned
14 friend, Mr. Scott. And submissions which I suggest
15 simply do not bear scrutiny.

16 The first such submission was that
17 doctors, men and women of science, just don't think the
18 way lawyers and, certainly, other lesser mortals think.

19 They deal, Mr. Scott told you, with
20 objective facts and data. At page 927 of Volume 154,
21 Mr. Scott, speaking of a man of science, said:

22 "He does not create any hypothetical
23 possibilities. Rather he searches
24 from possibilities that arise from
25 the facts with a data base itself.
He does not add any possibility onto

1
2 "his list of diagnoses that does not
3 have some factual foundation in
4 objective data as it relates to a
5 particular patient. He does not
6 deal, and this will be odd to
7 lawyers, in trends, statistics or
8 averages. The last case does not
9 exist in the diagnosis of the next
10 case. Although cases may have in the
11 end common features, each case for a
12 doctor must be examined uniquely and be
13 diagnosed exclusively on the facts
14 that case alone reveals. That is the
15 scientific approach."

16 And to that, sir, I make three responses.

17 First, I say with respect that it is
18 simply not so. Everyone, be he physician, surgeon,
19 lawyer, nuclear physicist or TV repairman, brings to
20 each new situation his own stored experience and the
21 shared experience of his peers and predecessors.

22 If my learned friend is really
23 suggesting that for every new patient a physician re-
24 invents either diagnostic or therapeutic wheel,
25 that suggestion simply does not make sense. And,
here, as the summer of 1980 lengthened into the fall

1
2 and winter it must have been plain and, indeed, on the
3 evidence it was plain to the cardiologists at the
4 hospital that they were seeing deaths on the wards in
5 numbers that were unprecedented in their experience
6 and that the sheer numbers demanded an explanation or
rationalization.

7 The professionals say that it is clear
8 to physicians and surgeons by December of 1980 that
9 treating these deaths one by one as they occurred was not
10 productive and that a retrospective look at the whole
11 six month period was required to see if any global
12 explanation could be found.

13 Clearly, on the face of the record,
14 the impetus coming from Dr. Trusler in December, in a
15 meeting held early in January, tells us that doctors
16 did not, as this period progressed, view these matters
one at a time.

17 Second. If physicians and other men
18 of science were indeed to pay no attention to anything
19 that they could not observe, record, weigh and measure
20 in the particular case, then in a practical world they
21 would be fools and these physicians are clearly not
fools. They are the cream of their profession.

22 Medicine is an applied science and in
23 a real world practical realities of what is happening
24
25

1
2 about them have to be borne in mind. I don't mean that
3 these physicians should have contemplated the existence
4 and operation of deliberately malignant agencies, but
5 only that when confronted by unusual situations they had
6 to be prepared to look carefully for unusual explanations.

7 And, third. It is clear that the
8 cardiologists did look for unusual explanations and
9 they did not behave and think in the narrow and,
10 perhaps, blinkered way that Mr. Scott suggests is
habitual for scientists.

11 In light of what Mr. Scott has said,
12 I feel obliged to say this, sir. That if there is a
13 criticism to be made of the cardiologists at the
14 hospital it is not that they thought as only scientists
15 think, as Mr. Scott suggests, it is that they did not
16 think as scientists think. They produced hypotheses
17 which might well have explained the increased number
18 of deaths. They formed the impression, or hypothesis,
19 if you will, that they were dealing with a younger,
20 sicker ward population. They formed the impression,
21 or hypothesis, that there was a shortage of nursing
22 staff at night. And those are perfectly respectable
23 and plausible hypotheses, but scientific method, as
24 I understand it, doesn't end with the formulization
25 of a hypothesis; it goes on to test the hypothesis;

1
2 it goes on to probe it, to challenge it, to examine
3 it and ultimately to accept it as valid, to reject it
4 as invalid or to reformulate it. And the huge sadness
5 is that the cardiologists did nothing to test either
6 of the hypotheses which they formulated to explain
7 these deaths. Enquiry would have demonstrated the
8 invalidity of each of their hypotheses and the bright
9 minds of those supremely skilled doctors would have
10 been forced to look elsewhere for an explanation of
the ward deaths.

11 It is not my purpose to attack or to
12 be critical of any members of the very dedicated staff
13 of that hospital. And in my submissions I avoided any
14 such criticism. Even if criticism be out of place in
15 your report, I felt obliged to respond to my learned
16 friend's submissions that the approach of the doctors
17 here can be justified on the grounds that they don't
18 approach problems. They don't think in the way that we
and you and I, and other people do.

19 I won't bother too much with that
20 except my friend goes further with it.

21 Mr. Scott's proposition, if it were to
22 be accepted, would not serve only as a justification
23 of the hospital's response to the events of the epidemic
24 period, it would serve also as the touch-stone for what
25

1
2 you can properly say in your report. Because my learned
3 friend, Mr. Scott, says that your report has to have
4 credibility for the medical and scientific communities
5 and to have such credibility it may only traffic in the
6 coin of what he says is scientific thought, and
7 certainly containing nothing that is not susceptible
8 of proof, and there is no room for impression,
9 suspicion or ambiguity, he would have you say.

10 By way of response to that, I say that
11 even if my learned friend be correct about the special
12 way in which scientists think, scientists comprise but
13 of the constituencies to be served by this Inquiry and
14 by your report.

15 It is, of course, important that the
16 questions of physicians and scientists be satisfactorily
17 answered, but it is, in my respectful submission,
18 vastly more important that other constituencies whose
19 members may not think as scientists do, that other
20 constituencies find your report satisfactory. I refer,
21 of course, to the parents in particular and to the
22 public in general.

23 Now, Mr. Scott has, of course, made
24 submissions that the non-scientists, too, will best
25 be served by this scrupulous avoidance of any
expression of suspicion or concern in your report.

1
2 He says, if I understand him correctly,
3 that where using some clear standard of proof you are
4 satisfied as to the cause of death of any child you
5 should clearly so state, but he also says that when
6 you have any measure of uncertainty you must report
7 merely that you cannot report on how a child died and
8 you should not record any suspicions that you may
entertain.

9 And that proposition, in my submission,
10 comes to this: that suspicion has been rampant for too
11 long and the way to put an end to it is to refuse to
12 acknowledge its existence. And in my respectful
13 submission a totally untenable position.

14 It is naive, I suggest, to think that
15 any persons or parents - particularly any parents -
16 concerns, fears or suspicions will be laid to rest by
17 your saying you simply cannot express a conclusion as
18 to how a child died. Now, equally, I acknowledge that
19 your reporting that you find a child's death to have been
20 suspicious is not going to bring comfort or certainty
21 to that parent, but since, on either basis, comfort and
22 certainty are simply not available, whatever you say,
23 that it should, in my submission, be at least total
24 honesty. The parents and the public can demand no more,
25 but I suggest that they deserve no less.

1
2 And if your view at the end of the day,
3 sir, is that baby A's death cannot with confidence be
4 classified as either natural or not natural but that
5 there is evidence which, viewed as a whole, causes you to
6 entertain suspicion that the death may not have been due
7 to natural causes, you should, in my submission, say so.

8 If I may say so, the public and parents,
9 I suggest, are not looking for scientific certainty.
10 I hope there are two ways to expect that. What they
11 do look for is the best judgment and common sense of
12 one who by training and experience and by reputation
13 knows how to sift and weigh evidence and to express a
14 measured, considered opinion.

15 It is clear from what the Attorney
16 General said in announcing your appointment to the
17 Royal Commission that the prime object of this whole
18 exercise was, in my submission, it remains, to have a
19 complete public hearing of all the matters surrounding
20 and relating to these sad events. And, in my submission,
21 there is no merit to Mr. Scott's suggestion that to
22 that purpose applied only to the hearings and has now
23 been achieved and that a different, more closed mouth
24 considerations are applicable to your report.

25 In my submission, the public will not
be well served by anything less than your full and

1
2 frank view of all of the evidence.

3 Mr. Scott's guidelines, if they were to
4 be followed, would, I suggest, result in a report that
5 understated the extent of the concerns that you might
6 have. It would minimize and contain the scope and the
7 true dimensions of what on the evidence that you
8 believe or suspect to have occurred at the hospital
in the epidemic period.

9 Nobody is interested in denegrating
10 the hospital. The hospital is too important to this
11 community for that. In my submission, the story has
12 to be told, once and for all, and for my part I find
13 it difficult to accept the reputation of the Hospital
14 for Sick Children is so fragile, or that its status is
15 so insecurely based, that either will be lastingly
16 damaged by the fullest expression of your views in
17 this matter. Quite the contrary. In my submission,
18 confidence in the long haul is restored by full
19 disclosure. It is damaged, and, perhaps, irreparably
20 damaged, by anything that is perceived as an attempt
to minimize or to cover up whatever may have occurred.

21 If there was indeed a killer on the
22 staff at the hospital I have to say that I have such
23 trust in the basic good sense of the public to believe
24 that it will recognize that that does not redound to
25

1

the discredit of the hospital.

We have all learned the bitter truth over and over again that no profession, no institution, no community can ever be immune from an aberrant or antisocial personality, and if I be right in that, the scope or even the suspected scope of such a person's activities is not a matter that you should be reluctant to consider or to state.

- - - -

1
2 In your consideration of it it is
3 my submission you are entitled, indeed obliged to
4 consider all of the evidence.

5 I respectfully adopt the submissions
6 of my friend Mr. Hunt who addressed Mr. Scott's
7 proposition of what he called the non-medical
8 circumstantial evidence should be ignored by you.

9 To say as Mr. Scott says that each
10 item of circumstantial evidence taken alone is neutral,
11 or ambivalent and thus of no probitive value is too
12 easy. Where the items coalesce to form a mass of
13 sufficient weight to give you concern, you are in
14 my submission entitled to so state. It is on such
15 bases that men and women make decisions that affect
16 their lives and the lives of those about them and in my
17 judgment the public wants to know and is entitled to
18 know what views you have formed and on of the
19 evidence. It may be confident that will not
20 likely entertain or express suspicion, but if you
21 do entertain it then in my respectful submission
22 you must say so with the reasons therefore.

23 In that regard I reject respectfully
24 but utterly Mr. Scott's attempt to equate any views
25 that you might form as to levels of suspicion
surrounding certain deaths with the ill-founded

1
2 suspicions, hunches, guesses of the man on the
3 street or a fortune teller was one of his expressions.
4 I know my learned friend had no intention to give
5 offence when he made that attempt. It is in my
6 respectful submission idle to say any suspicions
7 you may harbour, after hearing and considering all
8 of the evidence, will be viewed by the public as
9 adding nothing of value to the general understanding
of this affair.

10 In the more than three years since
11 the matter of the baby deaths came to the public's
12 attention there have no doubt been rumours,
13 speculations, gossip and expressions of suspicion, all
more or less ill-founded.

14 It cannot seriously be suggested
15 that the seriously held suspicions of one such as
16 you, who has heard, sifted and weighed all of the
17 evidence that has been adduced here, will be regarded
18 as merely more of the same badly informed stuff.
19 If after serious consideration you should conclude,
20 sir, that there are elements in the evidence about
21 the death of any child that caused you to suspect
22 that digoxin toxicity may have played a part in that
death, then in my suspicion it is for you to say so.

23 May I turn from matters of the approach
24
25

1
2 urged upon you by Mr. Scott on particular matters.
3 Mr. Scott has suggested that there was no evidence
4 that oral resuscitation efforts in the cardiology
5 wards in the epidemic period were unsuccessful. His
6 point as I understood it was that an inability to
7 resuscitate a child in the epidemic period was a
8 matter of no significance.

9 Now the incidence of Code 25 calls
10 and of successful resuscitation efforts was in fact
11 examined by the Authors of the Atlanta Report, and
12 the evidence about it is found in Volume 90 beginning
13 at page 289, the following exchange beginning at line
14 8 occurred and this is in direct examination by myself.

15 "Q. You also considered the
16 incidents of Code 25 calls. You
17 looked at those on a quarterly basis
18 from January 1979 to March 2nd, 1982.
19 What information was available with
20 respect to Code 25 calls?

21 (ANSWERS BY DR. WALLACE)

22 A. The only information available
23 was a log kept by the telephone
24 operator.

25 Q. Internal telephone operator of
the Hospital?

1

2

"A. Yes. This was the source of data
that we worked from on this.

3

4

Q. What information was contained
in the log?

5

6

A. It simply contained the date and
the time of the call and the ward to
which it had been directed.

7

8

Q. Not the patient?

9

10

A. No, there was no patient
identification.

11

12

Q. Do you recall that in the nine-
month epidemic period there were some
27 Code 25 calls to the cardiology
wards.

13

14

I understand you were working with
what, 35 or 36 deaths in the period?"

15

16

And Dr. Smith answered.

17

"A. 56 altogether ward associated
deaths, 36 in the epidemic period.

18

19

Q. 36? I tell you I am aware of
5 patients who died on the ward in
the epidemic period for whom there was
a "Do not resuscitate" order in effect
and I believe on page 15 of your report
you also say 5 of the 36 were classified

20

21

22

23

24

25

1 "as 'do not resuscitate' about a little
2 over a third of the way down the page,
3 and those five as I recall it were
4 Floryn, Heyworth, Leith, Murphy
5 and Perreault.

6 I can only give you my best recollection,
7 but my best recollection is there were
8 resuscitations efforts on all the
9 other children. I don't know whether
10 you have similar recollection from
11 your review of anything you took from
12 the charts, but obviously the
13 mathematics don't compute if I am
14 right?

15 A. There may have been a resuscitation
16 effort for which there was no Code
17 25 called. If the physicians were
18 already on the ward --

19 Q. Right.

20 A. There might not have been a
21 call put through to the operator.

22 Q. Were you satisfied that the data
23 you received from the operator's log
24 was complete and accurate?

25 (ANSWERS BY DR. WALLACE)

A. We had no way of knowing. We

1
2 "have to accept this data.

3 We did discover some inaccuracies
4 in that she had used a 24-hour clock
5 and had forgotten to change the date
6 sometimes but --

7 Q. An easy thing to do, yes.

8 A. Minor things like that.

9 Q. Were you aware of any successful
10 resuscitation attempts on the cardi-
11 ology wards in the nine month period?

12 A. We were aware of only one
13 successful attempt in a child who
14 subsequently died four days later.

15 Q. This was Estrella?

16 A. Estrella I think."

17 And then Dr. Buehler said:

18 "A. Later in the report we mentioned
19 the Code 25 calls again and there
20 were Code 25 calls for whom we could
21 not identify the patient for whom the
22 call was made?

23 Q. Yes.

24 A. Therefore there may have been
25 more successful resuscitations."

Clearly they were not able to track

1
2 'any and the numbers they found were
3 more than completely accounted for by
4 the numbers of resuscitation efforts
5 they were aware of.

6 Miss Nelles in Volume 124, page 8188
7 said that her recollections took her
8 only this far, that in the epidemic
9 period there were no successful
10 resuscitation efforts other than the
11 Estrella one. Mrs. Trayner's
12 evidence was to the same effect.

13 It comes to this, Mr. Commissioner,
14 that in the epidemic period the
15 only known successful resuscitation
16 was with respect to the Code 25 called
17 for Janice Estrella on January 7th,
18 1981. Now whether that be a fact to
19 which you can attach any significance
20 at all when viewing in the round the
21 evidence concerning this child's
22 death, is of course a matter for you
23 to determine, but it does seem indeed
24 on the evidence that we have to have
25 been a notable feature notwithstanding
the normal 11 per cent to 15 per cent

1
2 success rate Dr. Rowe told us about
3 in resuscitation efforts, there is
4 no evidence of a successful resuscitation
5 on the cariology wards in this period
6 other than that of Estrella on January
7 the 7th.

8 Perhaps I can take this opportunity
9 at this point to respond to Mr. Scott's repeated
10 statements about the significance that I have
11 suggested might attach to any of these matters of
12 pattern or circumstances.

13 My learned friend Mr. Scott would
14 have you believe that my submission comes to this:
15 that if the death was sudden and unexpected that is a
16 suspicious element. If the resuscitation effort was
17 unsuccessful, that is a suspicious element.

18 If the pathologist could not identify
19 the cause of death at autopsy, that is a suspicious
20 element.

21 With respect I say that distorts my
22 submission and perhaps in the hope that I can clarify
23 it, if clarification be needed, I can restate it
24 for myself rather than have Mr. Scott restate it.

25 It is this, that there are certain
facts which in my submission compel you to approach

1
2 each and every one of these deaths not with a
3 presumption of a non-natural cause but with the need
4 to be alert for indications of a non-natural cause.
5 Those facts are these:

6 An increase which the epidemiologists
7 described as statistically significant in the on-
8 ward mortality rate, during the epidemic period.

9 A remarkable clustering of very,
10 very many of the deaths in a narrow time frame,
11 between 1 o'clock and 5 o'clock in the morning.

12 An observed strong association between
13 almost all of those deaths and one or more members
14 of a particular nursing team.'

15 The fact, if you accept my submissions
16 with respect to Cook, and a fortiori if you accept
17 my submissions about other children in that group
18 of 8, the fact that one or more children did die of
19 digoxin toxicity resulting from an unprescribed dose
20 of digoxin in an amount, according to the experts,
21 and in circumstances which make it at least difficult
22 and at most impossible to believe that the dose was
23 administered by accident or error.

24 Finally the fact that the spate of
25 deaths came to a sudden and total stop on March the
26 22nd, 1981.

1
2 I will have more to say about that
3 last point later in the context of commenting upon
4 Mr. Percival's submissions. At the moment I say
5 these are all matters which you as a whole can support
6 a conclusion that one or more babies died by foul
7 play. The question of course then becomes whether
8 there were any such, and if so, how many and which
9 babies died in that way. But in considering cases
10 where there is no, or no clear toxicological evidence,
11 I say you are entitled to look at all of those
12 circumstances. They are not necessarily neutral
13 circumstances, Mr. Scott contends.

14 The nature of a child's terminal
15 events and the symptoms displayed have to be
16 considered in my submission. They may be such that
17 you are able to say that digoxin toxicity played no
18 part in the deaths. He may have displayed none of the
19 symptoms that are recognized as suggestive of digoxin
20 intoxication. If on the other hand the child did
21 develop arrhythmias, sudden and severe bradycardia,
22 heart block, fibrillation, you cannot of course, and
23 I don't suggest that you can say on that evidence alone
24 that digoxin played a part in the death. It merely
25 tells you that you cannot rule digoxin out.

If on a review of all of the circum-
stances you come to a situation where there is no clear

1
2 natural reason for a child having died as he did
3 and when he did, and there is no circumstance or
4 event that rules out digoxin involvement, and there
5 are several factors that are consistent with digoxin
6 involvement, then on that total view and not on the
7 basis of any one circumstance you are in my submission
8 entitled to say, if it be your view, that you have a
9 level of concern or suspicion about that death, that
it may be attributable to digoxin toxicity.

10 Mr. Scott says you cannot, and I
11 should not place any reliance on patterns as to time
12 of death, or presence of hospital personnel. Because
13 he says, quite correctly, that some of the children
14 of whom I have submitted that their deaths were natural
15 also fit the pattern of time of death/presence of
16 nursing team and so on. In my submission my learned
17 friend's attack on the references to and use of the
patterns is misconceived.

18 If, for example, all 36 of the children
19 had had red hair and green eyes, one might see a
20 pattern or a common thread and entertain the
21 possibility that someone was selecting for death
22 babies with those physical characteristics. But I
23 make two observations, sir. One, it would not be
24 legitimate to assume without more that all of those
25

1
2 36 babies were killed. Because even children with
3 red hair and green eyes can be so deperately sick
4 that they die of their diseased conditions and some of
5 the 36 may have so died.

6 Second, the fact that eight, ten,
7 twelve of the those read-haired green-eyed children
8 did die naturally does not detract from the possible
9 significance of the common thread which with other
10 factors and circumstances might serve to arouse some
11 suspicion. So here in my submission the fact that
12 some babies while apparently fitting into the pattern
13 died natural deaths, does not detract from the
14 significance of the pattern.

15 Miss Kitley's point is right of
16 course, the smaller the number of elements in the
17 pattern the less significance the pattern has. There
18 is still a significant number of deaths which fall
19 into the pattern and which are not really natural.

20 Finally with respect to Mr. Scott's
21 binder of materials about the babies. I must say I
22 commend him and his helpers for the industry in
23 compiling the material. As is always the case with
24 summaries of views and opinions, the binder contains
25 in my submission numerous matters which don't completely
accurately or clearly summarize the evidence, but I

1
2 shall not take the time to detail those.

3 I point out merely, and I certainly
4 intend no criticism in doing so, that the document is
5 necessarily argumentative to some measure rather
6 than coldly objective and Mr. Scott was frank to
7 say that although objectivity had been aimed for one
8 could not discount the position which he has taken.

9 I turn to the submissions of Mr.
10 Ortved who referred to one matter only, and that only
11 for the sake of clarification. It arose in the
12 context, sir, of your exchange with Mr. Ortved, which
13 is found in Volume 155, page 1206, about the failure
14 of Drs. Freedom and Taylor to take any steps, or to
15 make any enquiry to check the 72 nanogram level reported
16 on Janice Estrella.

P/ko

Line 8, page 1206, sir, you said:

"They never asked the biochemist if
he made a mathematical error?

MR. ORTVED: They did not go back
to the biochemist. That was what
Dr. Mancer and Dr. Taylor considered
when they got together and they could
not run it to ground."

You commented on that and then
Mr. Ortved, at the bottom of the page, said:

"In fairness they did check it.

They did re-calculate it,
Mr. Mancer and Dr. Taylor did and
they found out the value of 72 was
correct and at which point in time
they decided that it must be an
artifact, that it must have to do
with the contaminated sample. That
was the evidence."

My point of clarification is really,
sir, that indeed it was the evidence but the checking
by Drs. Mancer and Taylor was in March after the serum
concentration of Pacsai had been reported. It was not
checking or enquiry that was made at the time of the
initial report of the 72 nanogram level in Estrella.

1
2 The evidence in that regard is found in Dr. Mancer's
3 evidence in Volume 40, page 8062, and again beginning
4 at page 8086.

5 I move to submissions made by my
6 friend Mr. Strathy and refer first to what I call the
7 Cook medication error theory. As I understand it
8 Mr. Strathy postulates that some time after 3:45 and
9 probably after the calling of the arrest an adult vial
10 of digoxin was administered via intracardiac injection.
11 He says the ward was ripe at that time for a medication
12 error, there was a very high stress level and the fact
13 that the digoxin had been locked up perhaps made people
14 less alert to spot the presence of digoxin on the crash
15 cart. He suggests that there was digoxin on the crash
16 cart and it had been overlooked in Costigan's search
17 earlier that night or that it had got there after
18 Costigan and Mounstephen had made their search, although
19 he thought the former was more likely.

20 In my respectful submission that is a
21 most unlikely scenario. Costigan was the man who had un-
22 covered the hideous digoxin problem. It was he who had
23 taken the Pacsai levels to Dr. Carver. He had on his
24 own initiative ordered a post mortem digoxin level on
25 Miller the previous week. He reported the Miller
situation to Carver again late on Saturday afternoon.

1
2 He had met with Carver when the awful news of Miller's
3 levels was available on Saturday afternoon. He more
4 than anybody was aware of the ramifications of the
5 Pacsai and Miller findings and, more important, of the
6 focus of the digoxin problem on the cardiology wards.

7 Now, Mr. Strathy suggests that
8 Costigan, not expecting to find digoxin on the crash
9 cart, may have been perhaps lulled into not checking
10 too closely. Costigan was not doing a general check
11 of all drugs on the crash cart. He was looking only
12 for digoxin. That is his evidence in Volume 45, page
13 129. If Costigan and Mounstephen were prone
14 that night to overlook digoxin on the crash cart
15 because they did not expect to find it, it is interest-
16 ing that they did find it on several crash carts in
17 several locations. Exhibit 205 discloses that the
18 cart was one of the places that they expressly looked.
19 It was found on Ward 4C on the cart, on 5C on the cart;
20 on 5B on the cart; on 7F on the cart and on 7G on the
21 cart. They were not so confident about finding this
22 drug on crash carts that they did not find it in six
23 locations. If they were alert enough to find it in
24 those other locations in my respectful submission it
25 is simply not plausible that they would have overlooked
digoxin on the crash cart in the prime target area which

1
2 was Wards 4A and 4B. Indeed, although the more
3 leisurely inventory taken the next day showed some
4 digoxin that Costigan and Mounstephen had missed
5 they had not missed any on Wards 4A and 4B. There was
6 every reason, in my submission, to believe that they
7 were exceedingly alert in that location to find and
8 record and to have locked up the digoxin. In my
9 submission it is simply not credible that Costigan
10 would not have checked 4A and 4B on the crash carts
11 within an inch of their lives and it is the sheerest
12 speculation that if digoxin was on the 4A crash cart
13 I suggest it flies in the face of reason to think that
14 Costigan missed it.

14 But even to accept it was there and
15 was administered, one has again to accept a whole
16 sequence of errors. Digoxin on the cart at all; adult
17 digoxin on the cart, not pediatric; missed by
18 Costigan and Mounstephen; not checked by the nurse
19 who picked it up and drew it up; not checked by the
20 doctor who took the syringe from her and administered
21 it. In my submission that is a most unlikely
22 sequence and Dr. Spielberg was the only one to concede
23 that any kind of a sequence like that was likely.

24 My friend Mr. Strathy continues to
25 compound his speculation by suggesting that the blood

1
2 sample recorded as having been drawn at 4:30 in the
3 morning was in reality drawn between 4:32 and 4:37.
4 As I understand it he so suggests because that was the
5 period, he says, when a new IV line was being started.
6 Even if that was happening at that time it is not in
7 my submission any reason to think that blood was with-
8 drawn after 4:30 as the sample was apparently labelled.

9 I say that for two reasons: first
10 there is nothing in the evidence to suggest that the
11 sample was drawn at any time other than 4:30. In
12 Volume 156, beginning at page 1351 my friend, Mr.
13 Strathy, read the evidence of Dr. Mounstephen,
14 beginning at line 9, Referring to the evidence of
15 Dr. Mounstephen you said:

16 "And then that was entered as an
17 exhibit and at line 15, page 133
18 and the question is:

19 'Q. You indicated both of these
20 are in your writing and Exhibit
21 No. 59 is the requisition number
22 05491 and it appears to have a time
23 on it in addition to the 6:05 time
24 that is stamped on the requisition.
25 There is another time that appears
you have written in.

1
2 "A. That's probably when I filled
3 it out.

4 Q. 04:30 hours?

5 A. Right. It was probably during
6 the cardiac arrest some time.

7 Q. So, 05491 would be a blood
8 sample that was obtained by somebody
9 during the arrest and you have put
10 on the time that the blood sample
was obtained. Is that correct?

11 A. Yes.

12 Q. 04:30 hours?

13 A. Right.'"

14 Now, there is nothing in that
15 evidence of Dr. Mounstephen to suggest that that 04:30
16 is not the right time to put on that sample as having
17 been drawn. There is certainly no basis there to
suggest that it was drawn at some later time.

18 Second, if as Dr. Mounstephen suggests
19 it was Dr. Jedeikin who drew the blood and drew it from
20 the femoral vein, and that also appears in the evidence
21 that Mr. Strathy read to you, sir, then the likelihood
22 is that that was done by Dr. Jedeikin before
23 difficulties were encountered with the IV because as
24 soon as the difficulties with the IV became apparent,
25

1
2 as Mr. Strathy has pointed out Dr. Jedeikin was busy
3 trying to get a new IV line going. Blood for sampling,
4 testing, assaying, in my submission would not be drawn
5 through the IV anyway. We have heard that sampling
6 of the injection site was bad practice. Drugs had
7 been administered by IV frequently since 4:20. In my
8 submission it is far more natural and reasonable to
9 believe that blood was drawn from some blood vessel
10 at the site other than that of the IV, the femoral
vein as testified by Dr. Mounstephen --

11 MR. STRATHY: Mr. Commissioner, I
12 only interrupt because I think that this is a matter
13 of evidence that my friend is putting to you. As I
14 recall I read to you the evidence of Dr. Jedeikin who
15 said that in fact the sample was taken when the IV was
16 put into the femoral vein and it was at that time that
17 the pull back was made and some of the blood was taken.
18 That is when the sample was taken. I do not have the
19 transcript with me, but I recall it was in Dr. Jedeikin's
evidence.

20 MR. LAMEK: My friend is right. The
21 difficulty is to know just when that occurred, I suppose.

22 My friend, though, uses the fact that
23 at 4:32 there was intracardiac administration of
24 adrenalin as indication that the IV was not running at
25

1
2 that time. Then he says if the IV had been running
3 then they would not have had to give the adrenalin
4 directly into the heart. That I understand was his
5 submission.

6 With respect, that is not the reason for
7 giving intracardiac adrenalin. As I understand it
8 injection directly into the heart is done to achieve
9 an immediate effect. It is a sort of special delivery.
10 I note of course that the intracardiac injections were
11 given at other times during the Cook arrest when
12 presumably an IV was in place at 0450 and 0453. We
13 have seen the same thing in other arrest situations
14 as well. The fact that the drug was administered by
15 intracardiac injection at 0432 is no indication of
16 whether the IV was running at that time or not. That
17 was not an emergency measure taken for lack of an IV,
18 it was an emergency measure taken for reasons of its
19 own.

20 Mr. Strathy's hypothesis in my
21 submission has other serious difficulties. First,
22 although digoxin and adrenalin ampules are indeed
23 clear and filled with colourless material, the
24 adrenalin ampule is significantly smaller and thinner
25 than the adult digoxin ampule, as found in Exhibit 224,
so you can observe them for yourself, has a red band

1
2 as contrasted with a gold band on the digoxin ampule.
3 In my submission there is sufficient difference to
4 reduce the likelihood of error.

5 Next, although Mr. Strathy stressed in
6 argument that the time of Baby Cook's arrest pre-drawn
7 and pre-prepared arrest medication was not in use thus
8 opening at least the possibility, however remote, that
9 the wrong drug was drawn up during the resuscitation
10 effort, he bases that on Dr. Spielberg's evidence and
11 refers to Dr. Spielberg. Dr. Spielberg was not on the
12 staff of the Hospital for Sick Children at the time of
13 these events and he could have no personal knowledge
14 as to whether pre-prepared adrenalin was on the crash
15 carts at the time of the arrest. Such evidence as we
16 have is against Dr. Spielberg's view, as adopted by
17 Mr. Strathy. I refer to Exhibit 294, sir.

18 Exhibit 294 is a memorandum from
19 Mr. Snedden on the subject of "CALL 25 and Ward 4A and
20 B." The memorandum is dated April 13, 1981.
21 Interestingly, attached to it is an extract from the
22 Nursing Procedures Manual of the hospital, a two page
23 extract. The foot of the second page is identified
24 "HSC/9/80" suggesting in my submission that the document
25 was circulated in September of 1980, in the early
stages of the epidemic period.

1
2 On page 2 of that extract the following
3 appears:

4 "The sodium bicarbonate, 8.42% and
5 Epinephrine 1:10,000, come in pre-
6 mixed syringes that require only the
7 screwing in of the 'barrel' containing
8 the drug. Further supply of these and
9 other drugs are in the top drawer of
10 the crash cart. If Epinephrine
11 1:20,000 is required, use a 20 ml
12 syringe, draw up 19 ml sterile water
and 1 ml Epinephrine, 1:1,000."

13 Dr. Spielberg's evidence, interestingly,
14 refers to the 1:10,000 concentration. It appears
15 from the extract from the nursing manual attached to
16 Mr. Snedden's memorandum that as of September 1980
17 epinephrine, adrenalin, was in pre-mixed syringes and
18 only needed to be attached to the needle and
19 administered. If that be so then of course the
20 possibility of error in the administration of adrenalin
becomes even more remote.

21 It is essential too, for Mr. Strathy's
22 hypothesis, that the digoxin which he says may have
23 been given in error was administered directly into the
24 heart because on the evidence that we have heard from
25

1
2 the experts there is no other way or route of
3 administration that could possibly explain the digoxin
4 concentration recorded in Baby Cook. He says there-
5 fore either that the 0429 adrenalin administration or
6 the 0432 adrenalin doses could have been the occasion
7 for the unintentional administration of digoxin and
8 he says that we don't know, with the 4:29 adrenalin,
9 how that adrenalin was administered. Then he suggests
10 that too could have been intracardiac administration.

11 True it is we do not know that with
12 certainty but we do know that it was apparently the
13 practice to indicate expressly intracardiac injections.

14 - - - -

19
20
21
22
23
24
25

-1

hr

1
2 If you would look at page 30 of the Cook Chart, sir.
3 Page 30 lists the drugs administered at during
4 resuscitation, the times of administration.

5 There are three injections, or
6 administrations, which are recorded as being intra-
7 cardiac. The 4:32 adrenaline, the 4:50 adrenaline
8 and the 4:53 calcium. And, my submission, the lack
9 of such a note of intracardiac injection with respect
10 to the 4:29 adrenaline at least strongly suggests
11 that that was not an intracardiac injection. And if
12 that be so, Mr. Strathy's theory is really in this
13 catch 22 situation.

14 If the blood sample for digoxin was
15 drawn at 4:30, as in my submission the evidence
16 strongly indicates, then the substitution of digoxin
17 for adrenaline in the intracardiac injection at 4:32
18 couldn't account for the dig level 72 measured in the
19 sample because that injection was after the sample.
20 That level, then, could only result from Mr. Strathy's
21 other choice of 4:29 adrenaline injection but unless
22 the 4:29 injection were intracardiac, as to which there
23 is no evidence, and indeed a suggestion from the
24 evidence to the contrary, unless that 4:29 administration
25 were intracardiac, digoxin administered I.V. at 4:29
could not, on any of the pharmacological evidence that

1
2 you have heard, account for the tissue levels found
3 in Cook. And, indeed, given the kind of dose that
4 is postulated, one adult ampule, a sampling of serum
5 taken one to two minutes after administration would
6 presumably be far higher than the 72 or 69, whatever
7 it was recorded.

8 Dr. Spielberg's evidence, in Volume
9 54, page 2013 and 1998 in that same volume, all
10 suggest that you would expect to find astronomically
11 high serum levels in a sample drawn so soon after
12 administration.

13 And finally, it is implicit in Mr.
14 Strathy's theory that Cook's arrest was caused not
15 by digoxin but presumably by his disease condition.
16 In other words, Cook suffered another severe blue
17 spell of the kind that occurred at 6:00 p.m. of the
18 previous evening which is what the physicians at the time
19 understandably thought.

20 Now, if that were so one must explain,
21 of course, why the inderal administered to the baby
22 at 3:50 had no beneficial affect as it had had at
23 6:00 to 6:30 the evening before.

24 There is three possible explanations,
25 I suggest. First, the one that which Mr. Strathy
must embrace, but although the inderal on Saturday

ANGUS, STONEHOUSE & CO. LTD. Lamek (Reply)
TORONTO, ONTARIO

1
2 evening had a wonderously restorative affect, on
3 Saturday morning, as on the evidence that sometimes
4 happened, it had none. That is one possibility.

5 Second, the other theory that we
6 have heard that by error digoxin was given instead
7 of inderal. And I have already made my submissions
8 as to the tenability or untenability as to that
9 suggestion; or third, what Baby Cook was suffering
10 at 3:45 was not a blue spell at all but toxicity from a
11 huge overdose of digoxin, as I said earlier.

12 In short, Mr. Commissioner, it is my
13 respectful submission that Mr. Strathy's theory as
14 to the death of Justin Cook, although creative and
15 imaginative, has too many holes in it to be plausible.
16 In my submission, it runs counter to the evidence and
17 blames rational inference that might be drawn from the
18 evidence.

19 Now, Mr. Strathy also made submissions
20 to the effect that medication errors could also account
21 for the digoxin levels in Babies Lombardo, Belanger
22 and Hines, and in so doing, he made submissions about
23 Dr. Secombe's substance X and about evidence as to
24 the elimination half life of digoxin and to SIDS, as
25 well. You have my submissions and those of Miss
Cronks on those matters. It would be of dubious

I-4

1
2 propriety to try to restate our submissions by way of
3 a reply and I don't do that.

4 The differences between Mr. Strathy and
5 Miss Cronk and me are clear - and I leave them with
6 you, sir.

7 Just two other matters which I comment
8 by way of reply.

9 Firstly, that Mr. Percival, that Mr.
10 Percival's added starter to the list of possible
11 explanations to the abrupt end of the epidemic period
12 on March 22nd, 1981.

13 Mr. Sopinka has spoken to this matter
14 this morning. I make no comment on Mr. Percival's
15 suggestion. It is true that there is not a scrap of
16 evidence for you to support it, but in candore there was
17 no evidence whatsoever to support the possible
18 explanations that I also listed in my submissions. I
19 merely wanted to make clear what my purpose was in
20 listing possible explanations as Mr. Percival, of
21 course, referred to that in the course of his argument.

22 My point was, and is, that the sudden
23 cessation of these deaths is itself a circumstance
24 which may assist you to a conclusion as to whether the
25 deaths in the preceeding nine months had been natural or
no. If they were natural deaths - and this epidemic

I-4

1
2 period ended not with a whimper but with a bang - and
3 the proponents of the theories that the deaths were
4 due to natural causes and to the most appalling run
5 of possible drug errors must persuade you that the
6 clinical picture and the alleged pattern of terrible
7 error that haunted the one nursing team on the one
8 ward for so long suddenly resolved themselves.

9 In my submission, as I have said, that
10 proposition defies credulity and I was attempting to
11 canvass other, perhaps more credible possibilities,
12 which might explain that sudden end but which necessarily
13 for to do to deliberate invention by someone in the
14 course of the patients who's death had been under
15 review. That was my purpose, it was no more than that.

16 And in response to Mr. Percival's
17 suggested fifth possibility explanation, I can only-
18 say that it had never been any part of my thinking,
19 and certainly is not part of my submissions, that more
20 than one person was involved in the deliberate
21 administration of overdoses of digoxin which, in
22 my submission, occurred.

23 As for my favourite explanation: that
24 changed circumstances on the ward following Cook's
25 death made it impossible for the perpetrator to
continue.

1
2 Mr. Percival says that these changes
3 were in place before Cook died and he, therefore,
4 seems to suggest that that cannot have been the
5 reason for the cessation of those activities. With
6 respect, he is wrong.

7 Prior to Cook's death, digoxin had
8 been locked up - or there was some delay in implementing
9 that order - and digoxin had to be double signed as
10 well as double checked. Although, again, we saw
11 from the review of the chart that double signing
12 wasn't immediately done either, but as of Sunday
13 morning, after Cook's death, a whole new raft of
14 changes came into effect; digoxin levels were drawn
15 on all the patients; post mortem digoxin was ordered
16 for every death; supervisors were on the wards with
17 keys overseeing all drug administrations. Those
18 things had not been in place prior to Cook's death
19 and those things are the matters to which I refer
20 when I say the circumstances so changed as to make
21 a continuation of any activity on the ward, interference
22 with children, difficult, if not impossible without
23 inviting certain detection.

24 Finally, sir, with respect to the
25 submissions of Miss Kitely. I make three brief points.

First, she may indeed attack the

1
2 methodology of the authors of the Atlanta Report as
3 much as she likes and the authors were frank to
4 admit that in some respect there methodology was less
5 than perfect. And she may use the Haines instrument
6 as a blunt instrument to club the C.D.C. as mightily
7 as she likes, but the end of it all she has to
8 acknowledge, as I know she did, that Dr. Haines and
9 his colleagues, having reviewed the Atlanta Report
10 and having set out what they believe to be proper
11 criticisms of it , had to say this... and I take the
12 liberty of repeating it, sir. It is on page 5 of
13 the summary... Roman V:

14 "Despite the difficulties with many
15 of the studies described in the report
16 we feel that several findings..."

17 And they refer to the key findings noted above. And
18 they are set out on pages Roman I and II:

19 "...are both valid and helpful in
20 documenting and understanding the
21 increased cardiology ward mortality
22 during the July, 1980 - March, 1981
23 period.

24 Furthermore, although each of the
25 individual studies can be criticized
from the perspective of epidemiologic

I-7

1
2 methodology, taken together they provide
3 convincing evidence that there was
4 indeed a substantial increase in
5 cardiology ward mortality that can best
6 be explained by untoward events in the
7 infant room of Ward 4A."

8 Going onto refer to associations with
9 Hospital personnel during the July, 1980 - March,
10 1981 period.

11 So, when the dust of methodological
12 dispute are all settled, as I read the Haines Report,
13 its conclusion is a method may not always comply with
14 what we believe to be ideal practice but there is not
15 an awful lot wrong with the conclusions. And in my
16 submission there is no sufficient basis for refusing
17 to accept the findings and conclusions of the Atlanta
18 Report.

19 Second, Miss Kitely took you through
20 a mathematical exercise about drug errors calculated
21 to show, as I understood it, the number of fatal
22 drug errors that could occur in the Hospital in a nine
23 month period. I believe she produced a result of
24 anywhere from 33 to 135 errors in a nine month period..
25 on the basis of estimates of the number of drug errors

1
2 that could occur in that period. And Dr. Kauffman's
3 view that less than one per cent - Miss Kately
4 conservatively took a .5 per cent would be fatal...
5 might even by forgiven the words annualizing her nine
6 month number, her number would be 44 to 180 fatal
fatalities resulting from drug errors in a year.

7 Now, I am obliged to say, sir, I have
8 some difficulty in understanding why, why to the fact
9 that the Registered Nurses are presumably involved
10 either in administration directly or in drawing up
11 drugs, presumably to be involved in the vast majority
12 of medication administration in the Hospital, why the
13 counsel for the Registered Nurses Association would
14 ask you to believe that a baby every two to eight
15 days is killed by drug error in the Hospital for
16 Sick Children. But, be that as it may, Miss Kately's
17 thesis still cannot explain why there is any reason
18 to think that in this nine month period there should have
19 been an unprecedented number of deaths on this ward...
20 or resulting, or not resulting, in drug errors. Why
21 those errors should have been made by the members of
22 one nursing team and why that team should have been
error prone, essentially when it was only working
at nights.

23 Once again, it may be that if you look
24
25

1
2 merely at the numbers that may be thrown up by incidents,
3 or presumed incidents of drug errors, and didn't pay
4 any attention to what was actually happening on the
5 wards, and the rather peculiar clusterings, to use
6 a neutral term, that are evident, one could say,
7 'yes, that number of deaths could occur by drug error.'
8 It is looking beyond those numbers and to the kind
9 of thing that, in my submission, rational and normal
10 human beings can only take into account when trying
11 to form a judgement of something that you say is not
the satisfactory explanation.

12 And Miss Kitely would have you ignore
13 the pattern of the deaths, which is essential to her
14 thesis they be ignored. In my submission, they cannot
15 be. They are there. They have to be dealt with. And
16 as the authors of the Atlanta Report pointed out
17 any explanation of the epidemic period of deaths must
18 take account of them. And those patterns, in my
submission, make Miss Kitely's theory implausible.

19 Finally, with respect to Baby Estrella:
20 Miss Kitely delivered written submissions to you, sir,
21 are found at pages 39 to 40 as they relate to the
Estrella Baby.

22 With respect to the providence of the
23 sample in which the 72 level was recorded, Miss Kitely

makes a number of points. First of which is found
on page 39:

"Dr. Taylor, who you remember did the
autopsy, could not remember whether or
not he had tied off the bowel. If he
had, a small amount of fecal contamin-
ation would have resulted. If he had
not, considerably more fetal contam-
ination would have occurred."

.....

1
2 I agree with that point entirely,
3 that is exactly what Dr. Taylor said that he couldn't
4 recall. But he did say and this evidence is found
5 in Volume 43, page 8722, that it was his usual
6 practice to tie the bowel at the top and the bottom
7 ends before cutting it.

8 Dr. Mancer, his evidence is found in
9 Volume 41 at page 8326 appears to have regarded it
10 as standard practice to tie the bowel before cutting
11 it, he said that Taylor would have done that.

12 Point 2, I have no difficulty with
13 that at all in Miss Kitley's formulation at page 39.

14 Point 3, she says "The protocol for
15 the gutter blood study specifically required in Item
16 5 that the bowel was to be tied off prior to the
17 removal in order to eliminate contamination of the
18 abdomen".

19 She goes on in Point 4:

20 "Therefore there is likely a
21 significant difference between the
22 circumstances surrounding the gutter
23 blood study and the Estrella sample,
24 because the risk of contamination on
25 the evidence with respect to Estrella
is very high."

And with that of course I take issue. The risk of

1
2 contamination is very high only if the bowel was
3 not tied. There is clearly no evidence that it was
4 not. There is no clear evidence either way, but we
5 do have as I say Dr. Taylor's evidence as to what
6 he usually did, and Dr. Mancer's understanding as to
7 what the practice was probably followed.

8 Now also we have Dr. Mancer's
9 evidence with respect to the development of the
10 protocol of the gutter blood study, it is found in
11 Volume 41, beginning at page 8326, and this is at line
12 21, sir:

13 "In Part A, where trying to duplicate
14 what Dr. Taylor did with respect to
15 tying parts of the bowel off, and it
16 was his practice, as I obtained from
17 him by telephone call shortly prior
18 to drawing up his protocol, I found
19 that he did tie the rectum and the
20 jejeunum and he tried to avoid
21 contamination by the contents."

22 I do not read that as saying that
23 at the time of the telephone call Dr. Taylor said that
24 is what I did. I read that as saying that Dr. Taylor
25 told him that was indeed his practice. A practice
which he apparently relayed to Dr. Mancer at the time

1
2 of the preparation of the protocol and not one that
3 he testified to here for the first time. They were
4 clearly attempting to duplicate what was done with
5 respect to Estrella, so as to validate to the extent
6 possible the results of the gutter blood study they
7 were undertaking.

8 Based on information from Dr. Taylor
9 it seemed the bowel was likely tied, that indeed was
10 Dr. Mancer's understanding. Therefore, in my
11 submission, the evidence as it has appeared before
12 you does not support Miss Kitley's proposition that
13 in likelihood there was high contamination from failure
14 to tie off the bowel.

15 Generally, in my submission, the
16 whole question of the possible digoxin contamination
17 from the bowel depends in the first place on whether
18 or not at the time of autopsy digoxin was present
19 in fecal material, if it was not the way the bowel
20 was tied would be relatively unimportant.

21 I concede readily that Dr. Taylor is
22 no expert on that matter, he is no pharmacologist
23 and he doesn't know anything about pharmacokinetics
24 of digoxin. He did not perceive that was a likelihood,
25 more important his practice appears to have been, and
there is no reason to think that he did not follow it

1
2 here, to eliminate to the extent that he could the
3 risk of contamination by tying off the bowel before
4 he cut it.

5 In short, Mr. Commissioner, in my
6 submission there are clearly questions about the
7 sample in which the 72 nanogram was measured, we know
8 that. In my submission Miss Kitley's points don't
9 change the question that you have to consider, that
10 is whether you take the view of Dr. Mirkin, Hastreiter
11 or Kauffman, and you have my submissions as to that.

12 I add only this, that although Dr.
13 Hastreiter and Dr. Kauffman took the cautious view and
14 said they couldn't conclude a high probability of
15 digoxin intoxication based on that 72 level, they and
16 Mr. Cimbura too said they wouldn't dismiss the level
17 completely. I don't know what that means, unless it
18 means this: That even though they acknowledge there
19 is a reasonable chance that the level may be what
20 Dr. Fowler called a true bill, they were not prepared
21 to assume that it was for the sake of formulating
22 an opinion based upon it.

23 Dr. Mirkin of course took a different
24 view in light of the overall results of the gutter
25 blood study and his is a view that I have urged upon
you.

1
2 Mr. Commissioner, those are my
3 submissions, I have kept my promise.

4 THE COMMISSIONER: You have indeed.
5 Have you any announcements to make?

6 MR. LAMEK: Only one if I may, sir.
7 We are as you know a couple of weeks away from the
8 beginning of Phase II. I think it would be useful if
9 Counsel, all Counsel who as presently advised have
10 standing in Phase II were to meet at an early stage
11 to talk about what may happen there. I am suggesting
12 tomorrow morning, if that be possible, in this room.
13 It will be a private meeting of Counsel only, those
14 with standing in Phase II, and perhaps at 10 o'clock,
15 would that be agreeable? Thank you, sir.

16 THE COMMISSIONER: Does anyone else
17 have anything. Well, we will meet again then on
18 Monday, the 9th of July, perhaps not all of us. If
19 there are any here that I won't see again I wish them
20 the best, God speed, and I hope some day I will be able
21 to join them in the practice before the Courts, or by
22 the Courts, whatever it is.

23 If things don't go my way, then I
24 will be happy to see you on the 9th of July.

25 MR. SHANAHAN: Thank you, Mr.
Commissioner.

THE COMMISSIONER: Until then.

Yes, Miss Kitley.

MISS KITLEY: After we resume are
we sitting five days, the week of the 9th?

THE COMMISSIONER: Yes, we are, that
is all Mr. Hunt's fault and I want everybody to blame
him, not blame me. We will not be sitting then for
the three weeks after that, once Mr. Hunt can lecture
the Crown-Attorneys, and once so I can lecture the
judges, and once in the middle for a true holiday.

MISS KITLEY: Thank you, sir.

---Whereupon the hearing adjourned at 12:35 p.m. until
Monday, the 9th day of July, 1984 at 10:00 a.m.
